

RE: PTC (Production Tax Credit)

To whom it may concern:

Some time back I decided to do a little digging into the impacts of the 'renewables' considered viable by the 'experts'. I was quite shocked to discover that most all the speculative issues with natural gas development are reality with wind turbines and solar panels. The impacts from these machines are astounding compared to natural gas whether its water, air, land, wildlife, or health. There's actually a few concerns with 'renewables' that are absent with natural gas like need for subsidies, jobs, viability/dependability and domestic sourcing.

Please consider the fact that Germany is now turning the page on 'renewables'. As I understand, they are building over 20 new coal fired electric plants. The renewables are unsustainable, unaffordable, and unreliable.

The word 'renewable' is certainly a misnomer when you consider the lifespans of these devices and the voracious appetite they have for natural resources.

Relative to wind and solar, natural gas is the greenest solution to power us into the future.

There's no need for any PTC for natural gas development. Please kill the PTC for 'unreliable' energy and remove the unfounded barriers to unsubsidized natural gas development.

Thank you,

Cris Pasto
